Timeline and deliverables for Team Project Part 2

Submission Details

Final Submission: **Wednesday 18th November 2026, 23:59**

Each Group is to submit a zip file to their lab group's xSITE Dropbox ('Team Project Part 2').

Please follow the naming convention carefully when submitting your project and structuring your folders.

Zip File Name: [LabGroup_TeamNumber_ProjectPart2Final]
same as Part 1
Zip File Folder Structure and Content:

- Engineering Report
- Project Code (all project and code files for your part 2 project)
- Test Script
- Git Repository History / TeamAId Task Management file
- Dockerfile

One Submission Only per team. If you wish to resubmit before the deadline, only the latest submission will be graded and all other submissions will be ignored.

1. Object Oriented Source Code

A fully object-oriented working CLI or GUI application with the four manager files, following at least SOL from SOLID principles and maintaining good programming practices throughout. Please refer to the Grading Criteria Part 2 document for details on how this will be assessed.

2. Engineering report (maximum 6 pages)

Required components:

- → All diagrams that help articulate your system including class diagrams and class relationships, and a data-flow diagram
- → Exception handling matrix — how the script handles: API connection failure, malformed API response, corrupt or missing data file, invalid user input
- → Explanation of how each mandatory OOP concept is demonstrated, and a brief SOLID justification (at least SOL)
- → New feature and Advanced Feature Overview

Hand-drawn diagrams are acceptable. The report must exist and contain all components.

3. Automated test script

A test script that verifies the core logic functions independently of the live API.

- Tests must cover logic manager functions with hardcoded sample AI responses
- Must run without a live API connection
- Must pass cleanly inside the Docker container

4. Git repository

The submission repository must show evidence of iterative development.

- Granular commit history — not a single large commit
- Commit messages must be descriptive (e.g. 'add validate_response with schema check', not 'update')
- Must have a working CI workflow that runs the automated tests (CD is not required)

5. Task Management Document

Include the task management file downloaded from TeamAId to show your teams management of tasks via the Kanban board and chronological progression throughout. Peer evaluation is also submitted via TeamAId.

6. Docker Container

The application must run inside a Docker container.

- Dockerfile provided in the repository root
